

3 write a note on context analysis

-> is a research method that involves analysing text or other data

to identify patterns and themes

is a research methodology that involves analysing the social

, culture , and environmental context in which a phenomenon occurs

4 what do you mean by secondary data

-> is data collected by someone else often for a different purpose

such as existing literature, government statistics or database

5 what is factor analysis

-> is a statistical technique used to identify underlying factors or patterns in a dataset

6 what do you mean by operation research

-> is the application of scientific methods and techniques

to optimize business processes and solve complex problems

8 distinguish between primary and secondary data in data collection

-> primary - is original data collected by the researcher themselves

collection of

surveys, experiments, observations

more expensive

secondary - is data collected by someone else

collection of reports, database
less expensive

10 explain importance of T-test

-> t test - is a statistical test used to compare the

means of two groups

imp - t test are widely used in research to compare the

effects of different treatments

12 explain scope of reserch in securities studies

-> the scope of research in securities studies includes analysing financial markets ,instruments and institutions

13 explain in detail ANOVA statistical method with example

-> ANOVA (analysis of variance) is a statistical technique used to

compare the means of three or more groups
it generalizes the t-test which is used for comparing only two groups

ANOVA is divide the total variability in a dataset into different sources

between group variance

withing group variance

if the variation between groups is larger than the variation within groups

hypothesis

null hypo, alternative hypo in detail

eg a crop researcher wants to compare the mean crop yields

of 3 different fertilizer mixtures
(A,B,C)

independent variable: type of
fertilizer

levels: A, B, C

dependent variable : crop yield

eg. anova can be used to compare the average returns of different investment portfolios

14 define case study and indicate its characteristics

-> a case study is an in depth analysis of a single case or a small number of cases

the case study can be an individual, a group, an event

case studies are used in social, educational characteristics

detailed analysis

contextual understanding

qualitative and quantitative data

real world context

multiple data source

15 what are the essential steps involved in qualitative research

-> is a research approach that focuses on

gathering and analysing non numerical data

essential steps

select a problem

review the literature

design the case study and select method

identifying a research question

collecting data

analysing data

report result

drawing conclusions

16 explain purpose of research report

-> is to communicate the findings and conclusions of a research study to others

to communicate with the

details, findings, analysis, conclusions

serves as a permanent record

allowing others to understand the basis of conclusion

informed decisions

contribute to knowledge

evaluate the researcher

17 explain multivariate analysis technique with example

-> is a statistical technique used to analyse multiple

variables simultaneously.

analyse relationship between many variables

(both independent, dependent).

it helps researchers understand real world problem

common technique to include:

MANOVA(multivariate analysis of variance):

compares the means of multiple groups across multiple

dependent variables simultaneously.

Multiple regression:

examines how multiple independent variables

predict a single dependent variable.

factor analysis:

used to reduce a large number of variables into

a smaller set of underlying factor.

eg.multivariate analysis can be used to analyse the relationship

between stock prices and various economic indicators.

18 what are the principals and characteristics of qualitative data analysis
-> involves analysing non numerical data such as text or images.

it is the process of collecting,analyzing non numerical data

such as text,imgs,audio to find meanings.

characteristics:

iterative

subjective interpretation
unstructural raw data
focus on meaning and context
principles:
transparency
data triangulation
researcher reflexive process
context sensitivity
use of coding and theme identification

21 what is mean by tabulation of data. what are the principals to

be kept in mind while tabulating data?

-> tabulation of data involves organizing and presenting data in a clear manner

it is the process of organizing raw data into a structured and systematic format typically rows and cols.

principles

clarity and simplicity:

the table should be easy to understand

clear heading and titles:

logical arrangement

proper footnotes and sources

appropriate measurement

manageable size

accuracy

consistency

22 what is standard derivation ? what are its merits and demerits?

-> sd is a measure of the dispersion of a set of data.

it is the average amount by which each data point in a set differs from the mean of that set

merits

provides a clear measure of variability

useful for comparing data sets

stable and reliable

basis of analysis

useful for normal distribution

demerits

sensitive to outliers

can be affected by skewness

complex calculations

assumes data

23 what do you mean by survey analysis ?

what are the principles of survey research?

-> it involves analysing data collected through surveys or questionnaires

it is the process of examining data collected from a survey

used a set of questions to gather info from a specific group of people

it involves qualitative ,quantitative info

principles

clear objectives

appropriate sampling

well designed questionnaire
validity and reliability
systematic data collection
appropriate analysis
clear and concise questions
representative sample
accurate data analysis
objective reporting

24 calculate the mean, median and mode for
the following data class frequency

0-10	10
10-20	11
20-30	18
30-40	26
40-50	22
50-60	08
60-70	05
100
